

**IN THE CLAIMS:**

The text of all pending claims, (including withdrawn claims) is set forth below. Cancelled and not entered claims are indicated with claim number and status only. The claims as listed below show added text with underlining and deleted text with ~~striketrough~~. The status of each claim is indicated with one of (original), (currently amended), (cancelled), (withdrawn), (new), (previously presented), or (not entered).

Please CANCEL claim 2 without prejudice or disclaimer; and AMEND claims 1, 9 and 13 in accordance with the following:

**Claim 1 (Currently Amended):** A method of manufacturing polycrystalline silicon thin film using a laser beam to crystallize an amorphous silicon thin film, the method comprising:  
forming an amorphous silicon layer on a substrate; and  
irradiating the amorphous silicon layer using a laser beam, and transversely moving the mask relative to the substrate by a translation distance such that the laser beam is overlappingly irradiated at an overlapping region on the substrate where amorphous silicon and a part of already crystallized polycrystalline silicon are exposed so as to increase an average width of the polycrystalline silicon grains,  
wherein a width of the overlapping region during crystallization corresponds to the translation distance, and is varied between 0.5  $\mu\text{m}$  and 2  $\mu\text{m}$ , and  
wherein the average width of the polycrystalline silicon grains is varied between approximately 0.2  $\mu\text{m}$  and 0.6  $\mu\text{m}$ , and is decreased when the width of the overlapping region on which the laser beam is overlappingly irradiated is decreased.

**Claim 2 (Canceled):**

**Claim 3 (Previously Presented):** The method of manufacturing polycrystalline silicon thin film according to claim 1, wherein a sequential lateral solidification (SLS) crystallization method is used for laser crystallization.

**Claim 4 (Withdrawn):** A thin film transistor comprising the polycrystalline silicon thin film manufactured according to the method of claim 1.

**Claim 5 (Withdrawn):** The thin film transistor according to claim 4, wherein an average width of grains of the polycrystalline silicon thin film is at least 0.2  $\mu\text{m}$ .

**Claim 6 (Previously Presented):** A method of manufacturing polycrystalline silicon thin film by crystallizing amorphous silicon using a laser beam, the method comprising:

forming an amorphous silicon layer on a substrate;

irradiating the amorphous silicon layer using a laser beam that passes through a mask such that polycrystalline silicon grains are laterally grown from a boundary between liquid and solid silicon, wherein the mask is provided with at least a light transmission region for passing a laser beam and a laser non-transmission region for blocking the laser beam, and the laser transmission region is wider than the laser non-transmission region by more than 1  $\mu\text{m}$ ; and

transversely moving the mask relative to the substrate by a translation distance such that the laser beam is overlappingly irradiated at an overlapping region on the substrate where amorphous silicon and a part of already crystallized polycrystalline silicon are exposed.

**Claim 7 (Previously Presented):** The method of manufacturing polycrystalline silicon thin film according to claim 6, wherein the mask is formed in a rectangular shape having a stripe pattern of light transmission regions and light non-transmission regions.

**Claim 8 (Previously Presented):** The method of manufacturing polycrystalline silicon thin film according to claim 6, wherein a width of the overlapping region during crystallization corresponds to the translation distance, and is varied between 0.5  $\mu\text{m}$  and 2  $\mu\text{m}$ .

**Claim 9 (Currently Amended):** The method of manufacturing polycrystalline silicon thin film according to claim 8, wherein an average width of the polycrystalline silicon grains is at least 20.2  $\mu\text{m}$ , and is decreased when the width of the overlapping region on which the laser beam is overlappingly irradiated is decreased.

**Claim 10 (Previously Presented):** The method of manufacturing polycrystalline silicon

thin film according to claim 6, wherein a sequential lateral solidification (SLS) crystallization method is used for laser crystallization.

**Claim 11 (Withdrawn):** A thin film transistor comprising the polycrystalline silicon thin film manufactured according to the method of claim 6.

**Claim 12 (Withdrawn):** The thin film transistor according to claim 11, wherein an average width of grains of the polycrystalline silicon is at least 0.2.

**Claim 13 (Currently Amended):** A method of manufacturing polycrystalline silicon thin film, the method comprising:

irradiating an amorphous silicon on a thin film using a laser beam that passes through a mask ~~having a light transmission region and a light non-transmission region~~, to form crystalline silicon;

transversely moving the mask relative to the thin film by a translation distance; and  
overlappingly irradiating an already formed crystalline silicon in ~~an overlapping~~ region that corresponds to the translation distance and that has a width varied between 0.5  $\mu\text{m}$  and 2  $\mu\text{m}$ .

wherein the mask is provided with a light transmission region to pass the laser beam and a light non-transmission region to block the laser beam, in which a width of the laser transmission region is larger than a width of the laser non-transmission region by at least 1  $\mu\text{m}$ , and

wherein an average width of the polycrystalline silicon grains is varied between approximately 0.2  $\mu\text{m}$  and 0.6  $\mu\text{m}$ , and is decreased when the width of the overlapping region on which the laser beam is overlappingly irradiated is decreased.

**Claim 14 (Previously Presented):** The method according to claim 13, wherein the overlapping irradiation is done by moving the laser transmission region of the mask by the translation distance between 0.5  $\mu\text{m}$  and 2  $\mu\text{m}$ .

**Claim 15 (Withdrawn):** A thin film transistor comprising a polycrystalline thin film having an average grain width of at least 0.2  $\mu\text{m}$ , wherein the thin film was formed by

Serial No. 10/690,507

overlappingly irradiating a region of the thin film, the region being more than 0.5  $\mu\text{m}$  wide.
